ASSIGNMENT 6 — QUESTION 6

Q6 - E-Commerce Dashboard: Product Card Fetcher

JavaScript (ES6+) solution with comments

```
// Q6: Fetch products from Fake Store API using async/await.
// Run in a browser console or in a Node.js version that supports fetch.

async function loadProducts() {
    try {
        const response = await fetch("https://fakestoreapi.com/products");

        if (!response.ok) {
            throw new Error("HTTP error: " + response.status);
        }

        const products = await response.json();

        products.forEach(product => {
            console.log("Product:", product.title);
            console.log("Price: $" + product.price);
            console.log("Image:", product.image);
            console.log("------------------------------");
        });

        // Optional browser bonus: create simple product cards.
        // Add <div id="products"></div> to your HTML to use this section.
        const container = document.getElementById("products");

        if (container) {
            container.replaceChildren();

            products.forEach(product => {
                const card = document.createElement("article");
                const title = document.createElement("h3");
                const price = document.createElement("p");
                const image = document.createElement("img");

                title.textContent = product.title;
                price.textContent = "$" + product.price;
                image.src = product.image;
                image.alt = product.title;
                image.width = 120;

                card.append(title, price, image);
                container.appendChild(card);
            });
        }
    } catch (error) {
        console.error("Failed to load products. Please try again.", error);
    }
}

loadProducts();

/*
The API request is asynchronous: await pauses this async function until
the response arrives, without blocking the JavaScript event loop.
*/
```
