ASSIGNMENT 3

Q4 - Debugging Mystery

JavaScript solution

```
// q4.js — corrected version
"use strict";

function showMessage() {
  const greeting = "Welcome";
  console.log(greeting);
}

showMessage();

// Debug notes:
// 1. Set a breakpoint on the const greeting line.
// 2. Add greeting to the Watch panel.
// 3. Step Over, then inspect greeting in Local variables.
// 4. The Call Stack shows showMessage and then the global/script context.
```

Explanation / Debug notes

In the original code, greeting is assigned without declaration. Strict mode throws ReferenceError rather than silently creating a global property. Declaring it with const gives it local function scope. Use let instead if reassignment is required.

Run the code in the browser console or Node.js. Save each solution in its own .js file as required.
