# ASSIGNMENT 3

# Q8 - Strict Mode Showdown

## JavaScript solution

```
// q8-strict.js
"use strict";

// This is a syntax error in strict mode because duplicate parameter names
// are forbidden. It prevents the program from running.
function demo(a, a) {
  total = 10;       // Would be ReferenceError: undeclared variable
  delete total;     // Deleting an unqualified identifier is illegal
}
demo(5, 10);

// Correct ES6 version:
function demoFixed(first, second) {
  let total = 10;
  console.log({ first, second, total });
  // To remove a property, delete an object property, not a variable.
  const record = { total };
  delete record.total;
  console.log(record);
}
demoFixed(5, 10);
```

## Explanation / Debug notes

With strict mode, duplicate parameter names cause a SyntaxError; assigning to undeclared total causes ReferenceError; deleting an unqualified identifier is illegal. In non-strict mode, duplicate parameters and undeclared global assignment may be allowed, while delete on an identifier still fails or returns false depending on the context/engine. Test the non-strict version in a separate file without the directive; do not put both versions in one strict-mode script.

Run the code in the browser console or Node.js. Save each solution in its own .js file as required.
