ASSIGNMENT 5 — QUESTION 2

Callback Operations

JavaScript (ES6+) solution

```
function applyOperation(numbers, operation) {
    return numbers.map(operation);
}

const numbers = [1, 2, 3, 4];

const doubled = applyOperation(numbers, num => num * 2);
const squared = applyOperation(numbers, num => num * num);

console.log("Doubled:", doubled);
console.log("Squared:", squared);
```

Expected Output

```
Doubled: [ 2, 4, 6, 8 ]
Squared: [ 1, 4, 9, 16 ]
```

Explanation

applyOperation() accepts an array and a callback. Array.map() calls the callback for each element and returns a new array. Different callbacks let the same function perform different operations.
