ASSIGNMENT 5 — QUESTION 3

Arrow Function and this

JavaScript (ES6+) solution

```
const user = {
    name: "Mohit",
    showName: () => {
        console.log(this.name);
    }
};

user.showName(); // Usually undefined in a Node.js module or browser script

const fixedUser = {
    name: "Mohit",
    showName: function () {
        console.log(this.name);
    }
};

fixedUser.showName(); // Mohit
```

Expected Output

```
undefined
Mohit
```

Explanation

An arrow function does not create its own this; it captures this from the surrounding scope. Therefore, it does not refer to the user object when called as user.showName(). A normal method function receives this from the call site, so this.name refers to fixedUser.name.
