ASSIGNMENT 5 — QUESTION 4

Constructor and Prototype Method

JavaScript (ES6+) solution

```
function Car(brand, model) {
    this.brand = brand;
    this.model = model;
}

Car.prototype.getDetails = function () {
    console.log(`${this.brand} ${this.model}`);
};

const car1 = new Car("Ford", "Mustang");
const car2 = new Car("Toyota", "Corolla");

car1.getDetails();
car2.getDetails();

console.log(car1.getDetails === car2.getDetails); // true
```

Expected Output

```
Ford Mustang
Toyota Corolla
true
```

Explanation

getDetails is added once to Car.prototype rather than being recreated for each car. Both instances find the same method through the prototype chain, so the equality check returns true.
