ASSIGNMENT 5 — QUESTION 7

Closure with Multiplier

JavaScript (ES6+) solution

```
function makeMultiplier(multiplier) {
    return function (number) {
        return number * multiplier;
    };
}

const triple = makeMultiplier(3);
console.log(triple(5));
console.log(triple(7));

const double = makeMultiplier(2);
console.log(double(5));
```

Expected Output

```
15
21
10
```

Explanation

The returned inner function keeps access to multiplier even after makeMultiplier() has finished. This retained access to the surrounding lexical environment is called a closure.
