ASSIGNMENT 2 — Q6 — Event-Based Counter Simulation

Instructions: Save this solution in its own .js file. Run it in Node.js or the browser console.

```
"use strict";
let count = 0;
function increment() {
  count++;
  console.log(`Increment click: count = ${count}`);
}
function decrement() {
  count--;
  console.log(`Decrement click: count = ${count}`);
}
function simulateClicks() {
  function showCount() {
    console.log(`Count from nested function: ${count}`);
  }
  increment();
  increment();
  decrement();
  showCount();
}
simulateClicks();
console.log(`Final count: ${count}`);
```

Explanation: increment() and decrement() modify the shared count. The nested showCount() function can access count through lexical scope.
